DAXALGO RESEARCH // VERIFIED BACKTEST

Small forecast edge. No tradable edge.

CHMT-Q v1 | OKX BTC-USDT | June 2026 development study

DECISION

NO CAPITAL ALLOCATION

The model improves probabilistic scoring, but the observed edge does not survive costs.

2.26%
lower weighted pinball
vs empirical baseline

52.67%
anchor-close proxy accuracy
MCC 0.047

0 / 1,148
primary trades
all intervals crossed zero

-68.07%
aggressive strategy
base-cost compounded

EVIDENCE WINDOW

Jun 1 Jun 30

Only Jun 21-24 is genuinely unseen for this checkpoint.

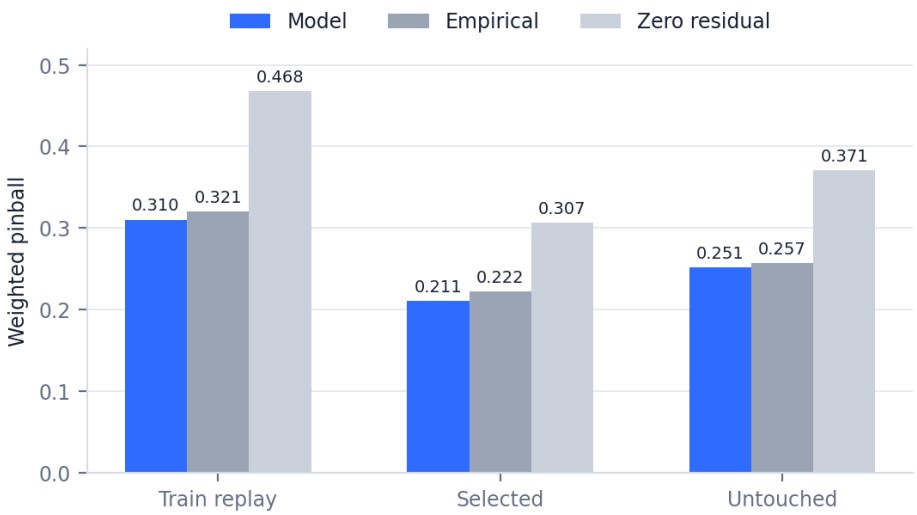

Study 086950d1edf9d23a | 34,344 predictions | 8,586 sealed rows untouched

01 // FORECAST QUALITY

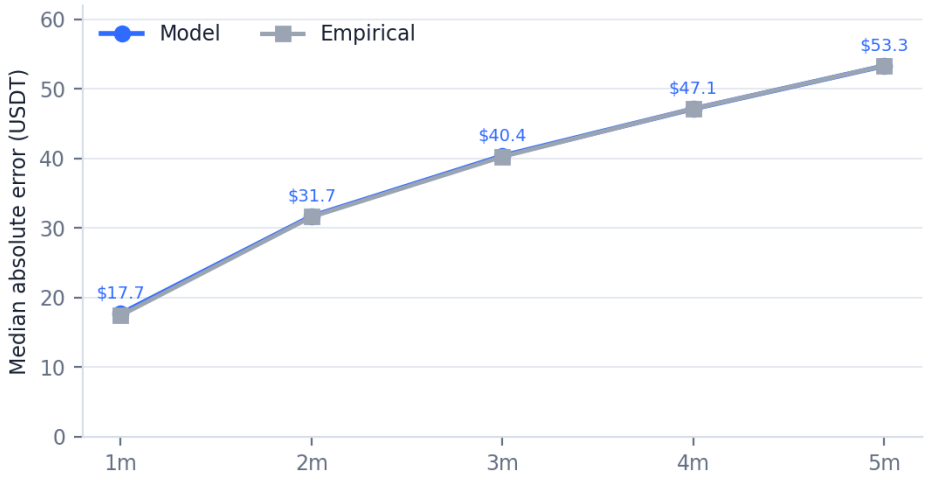

Forecast score improved. Point accuracy barely moved.

Probabilistic score versus training-only baselines; lower is better.

Weighted pinball

Total POC median error

2.26%

forward improvement

Model 0.251391 vs empirical 0.257193

53.28 USDT

five-minute POC MAE

Baseline 53.29 USDT - effectively tied

4 days

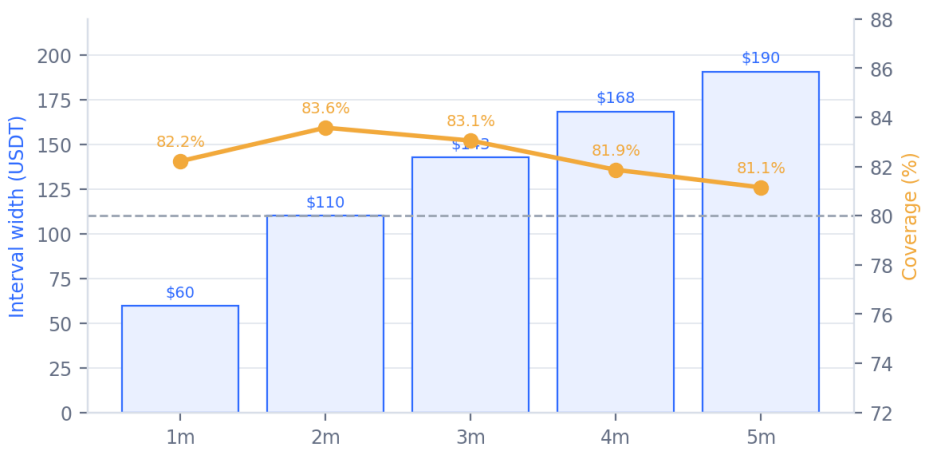

untouched evidence

Nominal effect interval [0.0005, 0.0126]

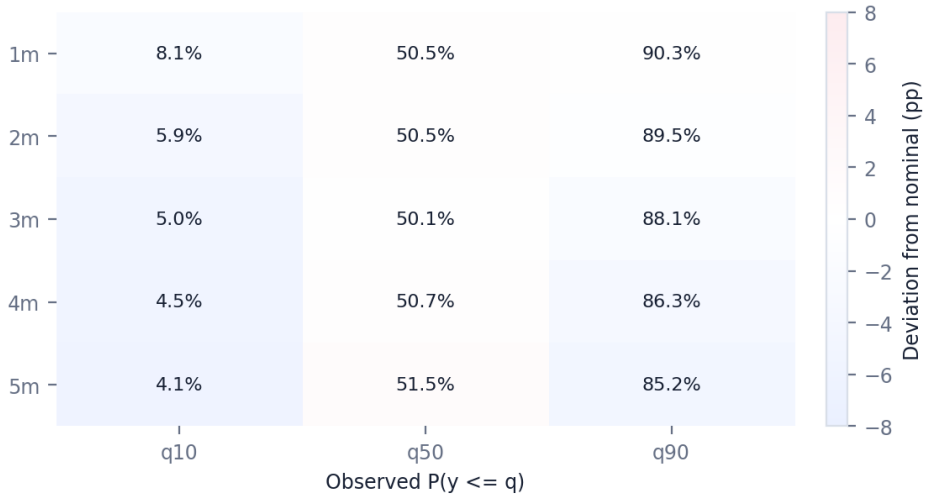

Coverage is acceptable because intervals are wide.

Raw q10-q90 intervals; no separate conformal calibration slice.

Total POC interval

Empirical quantile CDF

81.15%

five-minute coverage

Nominal target 80%

190.47 USDT

five-minute interval width

3.2x wider than one minute

99.91%

delta interval coverage

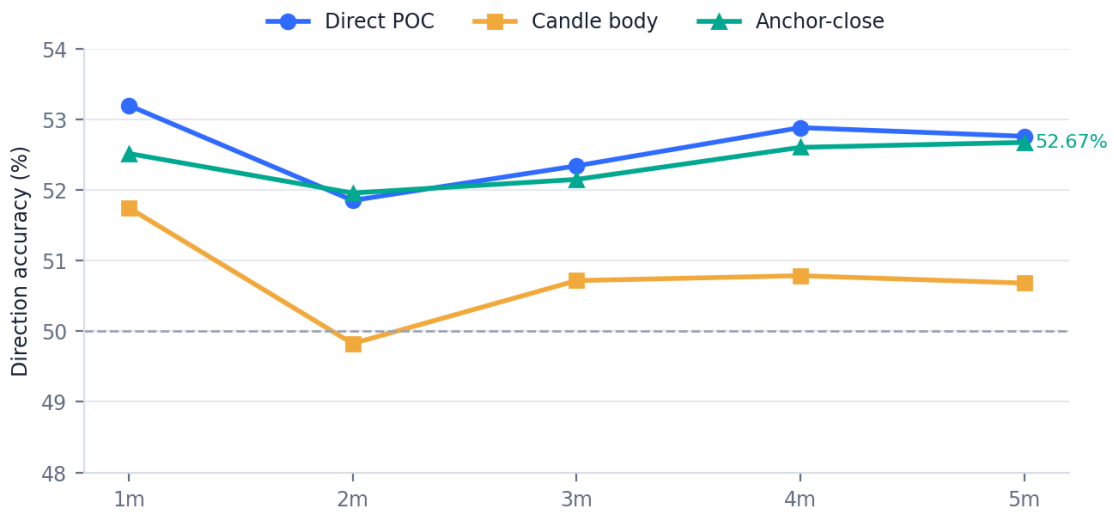

Width 1.992 on a [-1, 1] target - nearly uninformative

03 // FUTURE-CANDLE PROXY

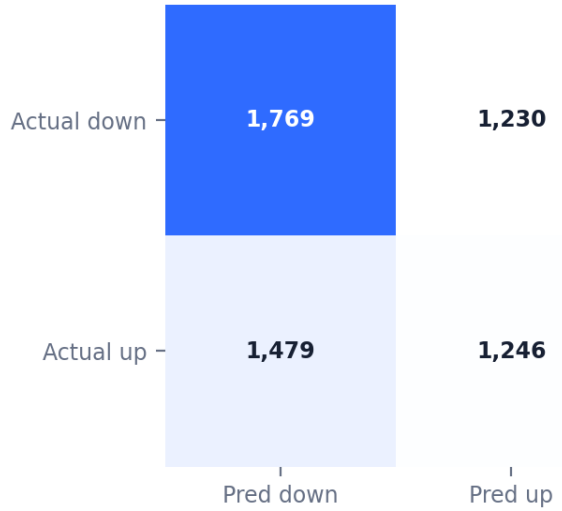

Candle association is weak.

Total-POC median used only as a downstream direction proxy - not an OHLC forecast.

Accuracy by horizon

Five-minute confusion

52.67%

anchor-close accuracy

Always-down majority: 52.39%

0.0475

Matthews correlation

Near zero association

0%

confidence-filter coverage

Every forward q10-q90 POC interval crossed zero

The primary strategy correctly abstained.

Non-overlapping five-minute trades; one-minute entry delay; 100,000 USDT illustration.

0 / 1,148

primary active trades

Interval long/flat stayed in cash

0 USDT

primary net P&L

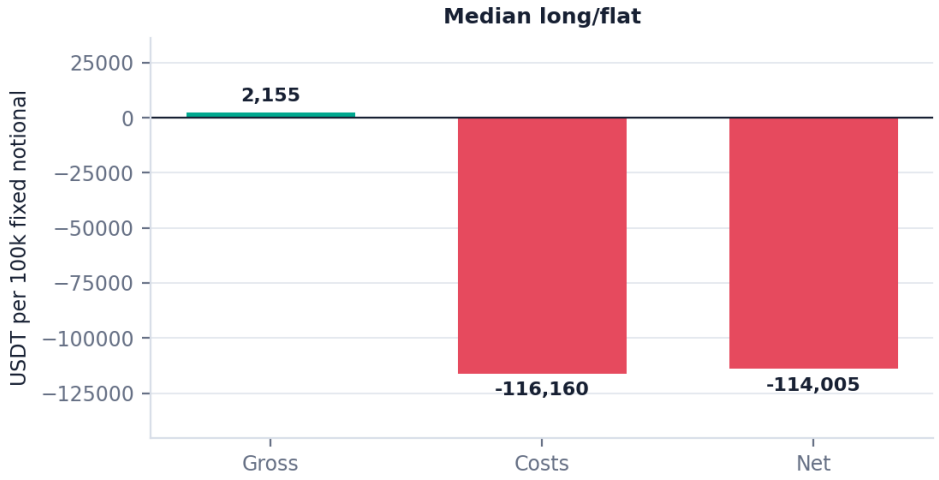

No trade is not evidence of alpha

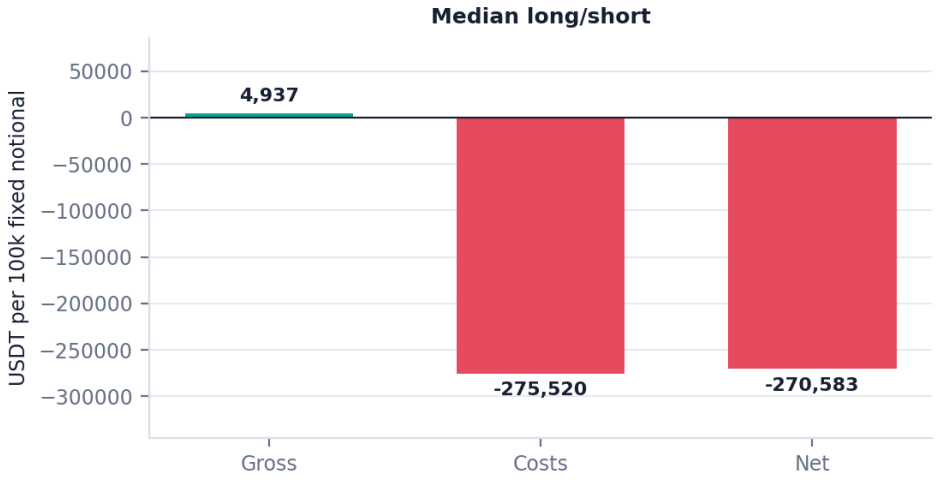

-5,209 USDT

buy-and-hold base P&L

Same price endpoints

Aggressive median policies - fixed notional

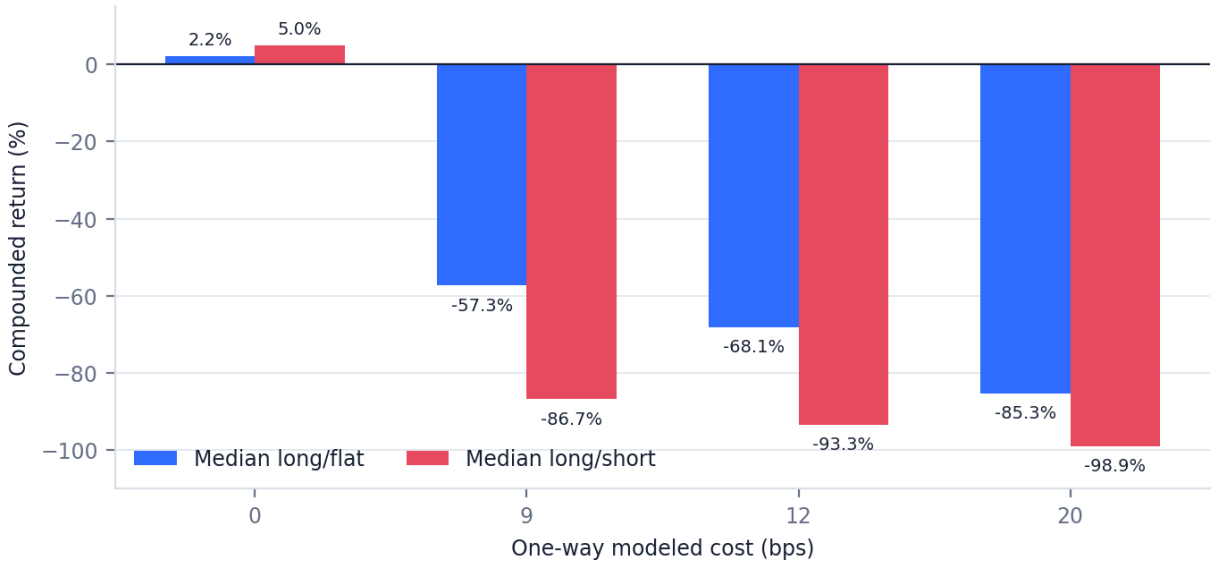

05 // COST SENSITIVITY

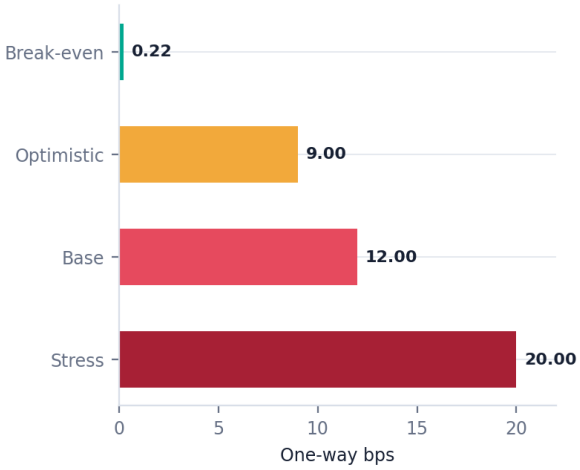

Turnover overwhelms the gross edge.

Compounded return under preregistered one-way fee plus slippage assumptions.

Compounded return

Break-even cost

+2.16%

long/flat frictionless

484 trades

+4.99%

long/short frictionless

1148 trades - hypothetical margin proxy

>50x

cost-to-edge ratio

Base 12 bps/side vs about 0.22 bps break-even

06 // DECISION

Do not deploy. Redesign the next experiment.

Current evidence supports local model research only.

AMBER

Forecast

2.26% better pinball

RED

Direction

MCC 0.0475

RED

Economics

No cost-qualified edge

RED

Evidence

One seed, four forward days

Next experiment

1	**Train on pre-June history**	Use several months and multiple regimes.
2	**Add a direct return target**	Keep candle/return outputs separate from footprint POC.
3	**Run at least three seeds**	Report every seed and expanding fold.
4	**Replay executable bid/ask**	Measure latency, spread, slippage, capacity, and short funding.
5	**Freeze one policy**	Consume a true external month once, after all choices are locked.

VERIFIED 34,344 unique predictions | 13.97M trades checked | 0 holdout overlap | 9 tests passed
